CS 373S P8: Object Oriented Frameworks

Jeff Bell - jhb2596   John Filippone - jpf735
jhbell@utexas.edu   johnpfilippone@yahoo.com

April 11, 2017

Running the Program

The program can be compiled and run using the following commands from the `filippone-bell` directory:

```
$ source setclasspath.sh
$ ./compile.sh
$ java Application.Main
```

Changing the Plugin

In order to change the plugin, simply change the commented line to initialize `instance` with the correct plugin's factory. (See lines 8 and 9 below)

Listing 1: "Application.Main.java"

```java
1  package Application;
2
3
4  public class Main {
5
6      public static void main(String args[]) {
7          Framework.Factory instance;
8          instance = new DPlugIn.Factory();
9          //instance = new BIPlugIn.Factory();
10
11          instance.NewGui().display();
12     }
13 }
```
